

UNIVERSITY ASSIGNMENT & DEADLINE MANAGEMENT SYSTEM

1. Introduction & Problem Statement

Universities handle a large number of assignments, projects, and academic activities every semester. In many institutions, this process is still managed through emails, paper submissions, or informal communication channels. Such traditional methods often lead to confusion, missed deadlines, and difficulty in tracking student submissions. Without a centralized system, students and lecturers spend extra time managing assignments manually, which can result in inefficiencies and human errors.

Students often struggle to remember multiple deadlines across various courses, especially when information is scattered or not communicated consistently. Lecturers face challenges in organizing submissions, managing late work, and maintaining accurate records, particularly in larger classes. These difficulties not only affect the workflow but can also impact students' academic performance and overall learning experience, creating unnecessary stress for both students and faculty.

To address these challenges, a web-based, centralized assignment and deadline management system is necessary. This system would automate notifications, enable online submissions, track grading progress, and provide comprehensive reports for performance monitoring. By streamlining communication and reducing manual tasks, such a system ensures that deadlines are met, records are accurate, and both students and lecturers can focus more on teaching and learning rather than administrative work.

Problem Identification:

- Lack of a centralized online system for assignment management.
- Students missing deadlines due to lack of automated reminders.
- Difficulty in tracking submission status and grading progress.
- Manual record keeping leading to human errors.
- Limited reporting and performance monitoring tools.

2. Project Goals & Objectives

The main objective of this project is to design and develop a web-based Smart University Assignment & Deadline Management System that improves efficiency, accuracy, and communication between students and lecturers.

Specific Objectives:

1. To develop a secure login system for students, lecturers, and administrators.
2. To allow lecturers to create, edit, and manage assignments.
3. To enable students to submit assignments online before deadlines.
4. To provide automated deadline notifications and alerts.
5. To generate reports for monitoring academic performance.

3. Development Methodology

The system will be developed using the Agile development methodology. This approach allows continuous improvement and flexibility during development.

Development Tools and Technologies:

Technology	Purpose
HTML	Design structure of web pages
CSS	Styling and responsive design
JavaScript	Form validation and dynamic features
PHP	Backend logic and server-side processing
MySQL	Database management

Development Phases:

1. Requirement Analysis – Gather system requirements from users.
2. System Design – Create database schema and interface layouts.
3. Implementation – Develop frontend and backend modules.
4. Testing – Perform unit and integration testing.
5. Deployment – Host the system on a web server.
6. Maintenance – Fix bugs and improve system performance.

4. Implementation Timeline

Phase	Duration
Requirement Analysis	1 Weeks
System Design	2 Week
Development	4 Weeks
Testing	1 Weeks
Deployment	2 Week
<i>Total Duration</i>	<i>10 Weeks</i>

5. Budget & Resource Estimation

Item	Estimated Cost
Requirement Analysis & Design	LKR 46,000
Software Development	LKR 433,000
Testing & Quality Assurance	LKR 92,000
Deployment	LKR 154,000
Maintenance & Support	LKR 185,000
<i>Total Estimated Budget</i>	<i>LKR 910,000</i>

The budget estimation includes development effort, testing activities, deployment setup, and future maintenance support. Actual costs may vary depending on hosting services and additional features.
